

PMOMax Cost Analysis Summary

Generated: Wed May 6 22:23:06 EDT 2026

Period requested: since 2025-08-01

Summary

The cost dispute should distinguish between:

1. Development/build phase infrastructure
2. Marketplace validation costs
3. Production pre-revenue idle/maintenance footprint
4. Required Marketplace/UBB metering components
5. Unnecessary or legacy services

Billing Data

Raw billing export attempt:

`raw/costs\_since\_august\_2025.csv`

If this file says no billing export was detected, use the Google Billing Console export or provide the billing CSV manually.

Key Interpretation

A strict sub-\$100/month cap does not appear to be demonstrated by infrastructure assumptions alone. However, once the product is live but pre-revenue, it is reasonable to move to a lean maintenance architecture.

Recommended Framing

The question is not whether costs should be optimized now. They should.

The question is whether historical development, validation, and Marketplace deployment costs were unauthorized or outside the assumptions under which PMOMax was built and launched.
