

PMOMax Infrastructure Audit Summary

Generated: Wed May 6 22:23:05 EDT 2026

Project reviewed: `katalyststreet-public`

Period context: since 2025-08-01

Executive Finding

The environment contains active production Marketplace infrastructure, including Cloud Run, GKE/Anthos-related resources, Artifact Registry, Marketplace/service-control configuration, monitoring/logging, and PMOMax Kubernetes workloads.

Key Evidence

See raw file:

`raw/infrastructure\_audit\_redacted.txt`

Operational Interpretation

The infrastructure should be optimized for the pre-revenue phase, but the audit should distinguish between:

- required production/Marketplace components,
- validation-related components,
- idle or legacy components,
- and resources that cannot be safely removed without dependency review.

Recommended Review Categories

Must Keep Until Re-Architecture Is Confirmed

- Cloud Run production runtime
- Artifact Registry images referenced by production
- Marketplace/Service Control configuration
- Any GKE workloads involved in UBB/metering or active PMOMax production behavior

Candidates for Reduction

- duplicate runtime layers
- stale image versions
- unnecessary scheduler jobs
- non-PMOMax App Engine or CRMint resources
- validation-only infrastructure after confirmation
